

Colorectal Cancer Fact Sheet

Introduction

Colorectal cancer is cancer of the colon or rectum. It's as common in women as it is in men. This year, over 142,000 people will be diagnosed with colorectal cancer and an estimated 50,830 will die of the disease. With certain types of screening, this cancer can be prevented by removing polyps (grape-like growths on the wall of the intestine) before they become cancerous. Several screening tests detect colorectal cancer early, when it can be more easily and successfully treated.

At Risk

- People age 50 and older
- People who smoke
- People who are overweight or obese, especially those who carry fat around their waists
- People who aren't physically active
- People who drink alcohol in excess, especially men
- People who eat a lot of red meat (such as beef, pork or lamb) or processed meat (such as bacon, sausage, hot dogs or cold cuts)
- People with personal or family histories of colorectal cancer or benign (not cancerous) colorectal polyps
- People with personal histories of inflammatory bowel disease (such as ulcerative colitis or Crohn's disease)
- People with family histories of inherited colorectal cancer or inherited colorectal problems

Risk Reduction and Early Detection

- Be physically active for at least 30 minutes, at least five days a week.
- Maintain a healthy weight.
- Don't smoke. If you do smoke, quit.
- If you drink alcohol, have no more than one drink a day if you're a woman or two drinks a day if you're a man.
- Eat fruits, vegetables and whole grains to help you get and stay healthy.
- Eat less red meat and cut out processed meat.

If you're at average risk for colorectal cancer, start getting screened at age 50. If you're at higher risk, you may need to start regular screening at an earlier age and be screened more often. If you're older than 75, ask your doctor if you should continue to be screened. The best time to be screened is before you have symptoms. Use this information to help you talk about screening options with your health care professional.

Consider one of the tests that find pre-cancer and cancer:

Screening Intervals

- Colonoscopy
 - Virtual colonoscopy
 - Flexible sigmoidoscopy
 - Double-contrast barium enema
- Every 10 years
 - Every 5 years
 - Every 5 years
 - Every 5 years

Symptoms

Early stages of colorectal cancer don't usually have symptoms. Later on, people may have these symptoms:

- Bleeding from the rectum or blood in or on the stool
- Change in bowel habits
- Stools that are more narrow than usual
- General problems in the abdomen, such as bloating, fullness or cramps
- Diarrhea, constipation or a feeling in the rectum that the bowel movement isn't quite complete
- Weight loss for no apparent reason
- Being tired all the time
- Vomiting

If you have any of these symptoms, see your health care professional.

Treatment

Surgery is the most common treatment. When the cancer has spread, chemotherapy or radiation may be given before or after surgery.
